

## Project 1 :

The idea is to build a tool for cinema schedule and ticket reservation in Tunisia for all cinema halls, admin dashboard for cinema owners, interested in events and going buttons like facebook, if reservation ticket done going checked , reminder before 24h , user must login to make a reservation, Calendar with date and time ps calendar should be user friendly, the user must be notified if there's at least less than 5 tickets in the event where a user checked interested, notification means browser notif not mail or phone message.

Search bar with movies and each movie, having the ability to comment on movies, and the time and date where it should be displayed. There's reviews on each movie. There's reviews on cinema halls.

Ad block in the top of the page that can be managed by the admin for ads, dynamic adds of new movies or new cinema halls.

Cinema owners have the abilities to add movies, with admin validation. It means they can add any new movie but it has to be validated by the admin to be listed on movies.

The project features are listed below:

- User management.
- Calendar management.
- Event management.
- Ticket Quantity management
- Ticket payment.
- Movie management.
- Rate, comment, review on movies
- Rate, comment, review on cinema halls
- Ads management by admin

Feel free to use any technologies, either you want to make a mobile app or website I would recommend using another plugin than CalendarJS for implementing a calendar you could even build your own with a different design.

Note: the site should e secured cause there's online payment, also it must be responsive.

## Project 2:

A very unique and user-friendly design for photographers, admin has the ability to add photos of his own work and displayed on a carousel in home page, a container to list sales and ads, book form to pick date and time for a photo shooting, also a place, google maps and Facebook and Instagram plugins must be implemented on home page.

If someone book at a time no one else has the ability to choose the same time, it means it's taken, pop up message: the booking time isn't available.

Features to implement in the website:

- Managing photo albums.
- Managing booking.
- Calendar management in admin if any change of schedule notifies the user by SMS and Email

Note: The website must be secure and responsive.

This project is specific to one client it means there's no different users only one admin which is the photographer and owner of the studio.
